

Is low light slowing your progress?

17 ways to blast tank floors faster

Advantages of having a blasting and painting site well lit

- 1** Obviously a major advantage of lighting up your site is the safety one – reducing expensive claims and staff leave by ensure the many hazards are visible to the blasters means injury and lost time are minimised. On tank jobs where multiple blasters/painters are working close together it is important that they can see and avoid each other too.
- 2** By having the correct lighting you get a cleaner surface first time around. This means that you get less re-work and it reduces the need to go back and clean up patches that were not cleaned to the correct specification due to poor visibility. This is a saving of time and money.
- 3** When a site is well-lit you can reduce the amount of time the whole tank takes to blast and paint. It actually takes less time because the blasters and painters have a clear view of what they are doing. One customer said that he saved 11% of the blasting time just by having good lighting and visibility inside his tank.
- 4** Good visibility means a much higher quality job and therefore no repainting because of coating failure. When the inspector or the customer checks the job for coating adhesion any areas of poor blasting or painting holidays can get very expensive. Light up and keep the inspector and your customer much, much happier.
