

What are the benefits of a ventilation system?

17 ways to blast tank floors faster

Advantages of a good ventilation system

- 1** Reduce the dust level inside the tank thus improving the visibility and allowing the blasters to blast without any visual hindrance. Reducing the amount of dust in the tank is a real winner. It is therefore important to have the ductwork from the ventilation system positioned close to where the operators are working, this keeps the work area close to them the clearest ensuring maximum visibility.
- 2** Look after your blasters personal safety by quickly drawing any hazardous dust or fumes from the area where the worker are blasting or painting. This is important as many of the old coatings contained lead or other harmful products and most paints release fumes which can damage the lungs and be intoxicating.
- 3** Reduce clean up time after blasting is finished because by moving the air and dust out of the area it does not settle back down over the newly blasted surface. This helps keep the fresh blast uncontaminated.
