

Move your equipment closer to the blasting area

17 ways to blast tank floors faster

Advantages of keeping your blast equipment close

- 1** You have to run less blast hose and air hose.
- 2** You have less bends and therefore less wear on the hoses.
- 3** You get higher performance and finish quicker.
- 4** You get higher pressure and a better blast.
- 5** Better communication between pot tenders and blaster/painters.

NOTE: It is important that the blast pot is as close as possible to the blasting area. If there is a space restriction and some equipment has to be further away, it is best that the distance is between the air compressor and the blast pot rather than between the blast pot and the blasters. This is because the friction and pressure loss is greater in the blast hoses which contains air and abrasive than it is in the air hose which is only carrying air - see below.
